VoiceObjects Factory© now available on Voxpilot's VoiceXML Gateway

VoiceObjects Factory©, one of the world's first Open Voice Application Platforms for the easy and fast creation of speech-driven services, has been fully integrated with Voxpilot's VoiceXML Gateway.

VoiceObjects Factory© is based on *VoiceObjects*™, core elements which are assembled into interactive dialogs of any complexity, following the lego principle. This technology ensures unparalleled ease of use and flexibility, and allows the designer or developer of a voice application to concentrate fully on optimal functionality.

Voxpilot, the leading pan-European outsourced VoiceXML Gateway provider, has fully integrated the VoiceObjects Factory© to help companies across Europe build voice applications via VoiceXML, the industry standard for voice application development and deployment, which is now dynamically generated from *VoiceObject* definitions.

"VoiceObjects Factory© has been designed for companies looking for an easy and rapid way of delivering powerful voice applications", says Dr. Jon Alcantara, the CEO of Voxpilot. "The benefits of speech-enabled applications – increased revenue, improved customer service, cost savings – are obvious to many companies, but they often lack the know-how to fully leverage the benefits of voice technologies. VoiceObjects Factory© enables the fast and easy construction of voice-controlled services for information, entertainment, customer services, and commercial transactions. These services are brought to end-users across Europe by Voxpilot."

"Simplifying voice technologies has always been the core idea behind VoiceObjects Factory© , and with the support of the Voxpilot platform it gets even easier for potential customers and partners to just install our software and run it in an off-premises configuration with Voxpilot" explains Tiemo Winterkamp, Head of Product Strategy & Research. "Often interested companies aren't able to invest into a full voice environment with speech recognition and telephony components. These companies can now start deploying voice services to their customer."

About VoiceObjects

VoiceObjects AG develops and markets VoiceObjects Factory©, the world's first open software platform for the simple and fast creation of voice-controlled services. Following the Lego principle, so-called VoiceObjects™ can be linked together for interactive dialogues of any complexity. VoiceObjects Factory© is an open platform based on standards such as VoiceXML or SALT, completely enclosing complex speech processing systems and other core technology. This enabling technology allows users and designers to easily manage voice-controlled services. For further information, please contact info@VoiceObjects.com.

About Voxpilot

Voxpilot is the leading pan-European outsourced VoiceXML provider, offering a range of tools and services for the deployment of revenue-generating telephony applications. Voxpilot's portfolio includes an online development environment (ODE), an outsourced VoiceXML gateway, support for multi-language VoiceXML 2.0, and local access telephone numbers for development and deployment in all major European markets. The voxBuilder Developer Programme is open for development, testing and demonstration use. Online tools include a File Manager, a VXML Validator, and a real-time Log Viewer. Voxpilot's flexible pricing and hosting models allow for the rapid and cost-effective deployment of innovative telephone-based applications. Developers can sign up for a free voxBuilder account at ode.voxpilot.com.
